EDUCATION

B.Tech, Computer Science & Engineering | MERI College (affiliated to MDU) | Expected 2029

EXPERIENCE

AI & ML Intern | Coding Arena | Mar 2026 – Jun 2026

- Engineered **RAG pipelines for LLM-powered applications**, integrating embedding generation, vector search, and contextual retrieval to ground model responses in application-specific data.
- Developed **FastAPI-based Python backend services and REST APIs** for LLM inference, NLP pipelines, and ML data-processing workflows, integrating model outputs into application services.
- Evaluated and debugged **LLM outputs** through prompt iteration, test-case validation, response-quality checks, and pipeline configuration tuning to improve reliability across application-specific workflows.

Software Trainee | Duastro | Feb 2025 – May 2025

- Maintained and optimized the company website, implementing **SEO, content, and on-page improvements** to improve search visibility and website performance.

PROJECTS

Jailbreak Oracle: Adaptive LLM Red-Teaming & Vulnerability Discovery Platform | Python, FastAPI, PostgreSQL/pgvector, LiteLLM, Next.js, React - https://github.com/Vagisha13/JailBreak-Oracle

- **Addressed the limitations of static jailbreak testing**, where fixed prompt datasets and manually crafted attacks provide limited coverage against evolving LLM defenses, by engineering an adaptive red-teaming platform that automatically generates and evaluates attack strategies.
- **Designed a multi-agent security architecture** comprising Attacker, Evaluator, Verifier, and Defender agents, with campaign orchestration and BYO-API testing through LiteLLM to test authorized LLM endpoints across providers.
- **Introduced an independent verification layer** that cross-checks evaluator findings before classifying an attack as successful, while pgvector-backed retrieval and evidence-grounded reporting provide traceable vulnerability findings instead of relying solely on model-generated judgments.

ForgeX: AI-Powered Digital Forensics & Investigation Platform | Python 3.12, WebSockets, RAG | NTRO Problem Statement (SIH26148) - https://forge-x-bice.vercel.app/

- **Addressed the challenge of investigating fragmented forensic evidence** across heterogeneous system sources by designing ForgeX as a unified platform for evidence collection, querying, correlation, and reproducible case workflows.
- **Designed FQL (Forensic Query Language)** to provide investigators with a domain-specific interface for querying forensic evidence, supported by OS-level evidence collectors, authenticated case management, and real-time investigation services.
- **Introduced evidence-grounded AI analysis** using embeddings, RAG, and structured outputs to analyze collected evidence while maintaining traceability between generated findings and their underlying evidence.
- **Built and demonstrated the working prototype**, placing **3rd in Code Manthan**, MERI College's internal SIH round.

GhostLine-AI: Enterprise AI Knowledge & Document Intelligence Platform | Python, FastAPI, RAG, FAISS, Embeddings - https://ghost-line-ai-delta.vercel.app/

- **Addressed the difficulty of searching and reasoning over fragmented private documents** such as PDFs, SOPs, contracts, and reports by building an AI knowledge platform that enables users to query proprietary information through natural language.

- **Engineered a document-to-answer RAG pipeline** using document processing, intelligent chunking, embedding generation, and FAISS-based semantic retrieval to identify relevant context before generating responses.
- **Implemented citation-grounded responses and multi-document retrieval**, enabling answers to reference the underlying source content rather than relying solely on the language model's internal knowledge.
- **Extended the system beyond basic document Q&A** with conversational context, streaming responses, and a FastAPI backend designed to support scalable AI knowledge workflows.

ACHIEVEMENTS

- **5× Hackathon Winner**; **Top-5 finisher in 25+ of 50+ hackathons** across AI/ML, Generative AI, cybersecurity, blockchain, and web development.
- **3rd Place — Code Manthan**, MERI College internal hackathon (SIH preparation), for **ForgeX**, an AI-powered digital forensics and investigation platform.

COMMUNITY & EVENTS

- Participated in **20+ technical events, workshops, and developer sessions** hosted by organizations including **Microsoft, Google, Paytm, and Master Union**.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, Java
AI/ML: LLMs, Generative AI, RAG, NLP, Deep Learning, Embeddings, Vector Databases, Prompt Engineering
Frameworks/APIs: FastAPI, Node.js, React, Next.js, REST APIs, OpenAI, LangChain, LiteLLM, Ollama, Gemini, Groq
Data/Infra: PostgreSQL, pgvector, MongoDB, MySQL, Supabase, Redis, Kafka, NATS, Git

VERSION 2: RECRUITER AUDIT

Strongest signals

- **Jailbreak Oracle.** The four agents plus a separate verifier is a specific design, which is rare at second-year level. It is the best-matched project for AI security roles.
- **ForgeX's FQL and evidence-grounded AI.** A domain-specific query language and a "findings must trace to evidence" rule are clear signs of design thinking.
- **Dated internship plus two founder roles plus hackathon wins.** Together they show you build and ship things.

Weakest signals

- **No numbers anywhere** except 150+ members and the hackathon counts.
- **Coding Arena is still generic.** Without the app, the vector DB and how you evaluated, it reads like a skills list.
- **Ghostline and ChainScribe are empty.** Two stubs look unfinished.
- **Duastro** is SEO and website upkeep, so it sits oddly beside the backend and AI work.

Credibility risks

- **Skills nothing else on the page supports:** Kafka, NATS, Deep Learning, Java, Ollama, Groq, Gemini, LangChain, MySQL, Supabase. An interviewer will pick one and ask. Python 3.12 is the only version detail confirmed.
- **"Founder" ×2 with no traction.** AiGlo needs the word "prototype" or a real user count. Without that, recruiters assume the worst.
- **Blockchain keyword.** SIH26148 is categorized "Blockchain & Cybersecurity", but nothing you have told me says ForgeX uses blockchain. I did not claim it.
- **50+ / 25+ / 5×** needs two or three named hackathons, or it reads as padding.
- **Real-time:** I wrote "WebSockets" because you listed WebSocket components. Be ready to explain what streams over them.

Missing information

1. Contact details, GitHub and LinkedIn. A GitHub link matters most for this profile.
2. Coding Arena: app purpose, vector DB, data source, how outputs were evaluated, one concrete deployment change.
3. AiGlo: dates, and whether anyone has used it (clients, pilots, demos).
4. AlGloryThm: dates, and a count of events if you have one.
5. ForgeX: stack beyond Python 3.12, plus whether anything beyond Code Manthan happened (shortlisted, finalist?).
6. Ghostline and ChainScribe: repo or README links.
7. Hackathons: names and years of your best 2–4 results.
8. Skills: where you used each of Kafka, NATS, Deep Learning, Java, Ollama, Groq, Gemini, LangChain, MySQL and Supabase.
9. Jailbreak Oracle: did you run campaigns against real models? Counts of attacks or findings would be a legitimate metric.

ATS issues

- Placeholders would break parsing if left in. Fill or delete each one.
- "Machine Learning" never appears spelled out. I have used it in the Coding Arena title.
- "Cybersecurity" and "Red Teaming" appear only in project text. The final version adds a one-line summary at the top.
- "Blockchain" appears only in the hackathon line. It stays there unless ChainScribe supports more.
- The Events section uses space that engineering work should get.

VERSION 3: FINAL OPTIMIZED RESUME

Changes from Version 1: events merged into one line under Achievements; skills cut to what the experience and projects support; plain-text summary added for parsing; Ghostline and ChainScribe compressed to one line each.

SUMMARY

Second-year B.Tech CSE student building LLM/RAG systems, LLM security tooling and digital-forensics platforms; AI & ML intern; founder of an AI automation product; 5× hackathon winner.

EDUCATION

B.Tech, Computer Science & Engineering | MERI College (affiliated to MDU) | Expected 2029

EXPERIENCE

AI & ML Intern | Coding Arena | Mar 2026 – Jun 2026

- Engineered RAG pipelines for LLM applications, combining embeddings, vector retrieval and contextual prompting to ground responses in application data [NEED: vector DB, use case]
- Built Python backend services and API integrations for model inference and NLP/machine-learning data processing [NEED: framework]
- Evaluated outputs and tuned prompts and pipeline settings to improve reliability [METRIC NEEDED: eval method/result]

Founder | AiGlo, AI Business Automation Platform | [Dates]

- Built an AI-assisted CRM and workflow platform that automates leads, customer communication and follow-ups for service businesses [NEED: "prototype" or user count]
- Integrated an OpenAI assistant with Calendly scheduling and lead records on Next.js and MongoDB, so it performs business operations rather than only chatting

Founder | AlGloryThm, AI & Developer Community | [Dates]

- Founded and lead a 150+ member AI/GenAI and coding community; run workshops and technical sessions on AI and emerging technologies

Software Trainee | Duastro | Feb 2025 – May 2025

- Maintained and optimized the company website; implemented SEO and content improvements

PROJECTS

Jailbreak Oracle: Adaptive LLM Red-Teaming Platform | Python, FastAPI, PostgreSQL/pgvector, LiteLLM, Redis, Next.js

- Built a multi-agent system (Attacker, Evaluator, Verifier, Defender) that adaptively generates and tests jailbreaks, replacing static datasets and hand-written prompts
- Implemented campaign orchestration, Bring-Your-Own-API testing across providers via LiteLLM, pgvector retrieval, and role-based access control
- Separated verification from evaluation so attack success is confirmed independently; reports link each vulnerability to its evidence

ForgeX: AI-Powered Digital Forensics Platform | Python 3.12, RAG, WebSockets | NTRO problem statement SIH26148

- Tackled manual collection and correlation of heterogeneous forensic evidence by building a structured, reproducible investigation workflow
- Designed FQL, a Forensic Query Language, and built OS-level evidence collectors, case management, authentication and investigation services
- Implemented evidence-grounded AI analysis (embeddings, RAG, structured output) tied to collected evidence; built and demoed the prototype, placing 3rd at Code Manthan

Ghostline | [one line after README]

ChainScribe | [one line after README]

ACHIEVEMENTS & COMMUNITY

- 5× hackathon winner [NEED: names/years]; top-5 in 25+ of 50+ hackathons across AI/ML, GenAI, cybersecurity, blockchain and web
- 3rd place, Code Manthan (college hackathon, SIH preparation)
- 20+ technical events and workshops, including Microsoft, Google and Paytm

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript

AI/ML: LLMs, Generative AI, RAG, NLP, Embeddings, Vector Databases, Prompt Engineering

Frameworks/APIs: FastAPI, Next.js, React, Node.js, REST APIs, OpenAI, LiteLLM

Data/Infra: PostgreSQL, pgvector, MongoDB, Redis, Git

Held back and preparation notes

Skills held back until you confirm use: Java, Deep Learning, LangChain, Ollama, Gemini, Groq, MySQL, Supabase, Kafka, NATS. Node.js is kept only because AiGlo likely uses it. Confirm it.

DSA/LeetCode: omitted until you give a verified count or profile link.

Interview questions to prepare for:

- Jailbreak Oracle: how does the Attacker adapt after a failed attempt, and what exactly does the Verifier check that the Evaluator does not?
- ForgeX: what does an FQL query look like, and how is it executed against collected evidence?
- RAG: how did you chunk, embed and retrieve? (Asked for both Coding Arena and ForgeX.)
- AiGlo: has anyone besides you used it?
